

Alpha and Bugs : eeeek!

Our app connect local chefs with the users. It is an Uber for Food, and the name of our app is Foober. Our app's initial view is the map which shows the nearby available "kitchens" The user can then tap on the pins in order to interact further. The interaction includes : tapping the pin and tapping the bubble in order bring a new view that displays out the menu and more detail.

Currently, the app display a map with nearby available kitchen. In our alpha, we are using dummy data that are nearby our current location. It will display pin for the kitchen. The user can click on the pin to display more information regarding the kitchen such as the name and address. Then, the user can navigate through the views using the tab under the map.

More to do :

- Create custom AnnotationView

- Create view for Menu

- Create view for each Item

- Create view for Order

- Make annotation bubble actionable

- Store data on Firebase
